India's Small And Medium Business Network

CoSoSys has announced the release of the latest version of Endpoint Protector 2008. This version has support for Red Hat Linux 5 and Fedora 9 as server operating systems, enabling companies already using these distributions to use Endpoint Protector 2008 on their existing hardware and software platforms.

Supporting a wider range of Linux distributions is essential for us, as it enables us to provide our customers with a solution featuring similar performance on multiple hardware and software configurations, so that they can utilize their existing server infrastructure and furthermore reduce their total cost of ownership. Additionally, if they need to change the current configuration, Endpoint Protector 2008 can be easily ported, at no additional cost, said Roman Foeckl, CEO, CoSoSys.

Modern users require an increasing number of portable devices as they depend on them to be able to work fast, effectively and conveniently, without putting data or network security at risk. Controlling the use of portable storage and lifestyle devices within a corporate IT environment is thus essential in preventing intentional data theft or accidental data loss.

With the help of Endpoint Protector 2008, corporate IT departments can proactively take control of what employees are allowed to use which devices, while keeping track of all data that is transferred in or out of the protected network through these devices.

Endpoint Protector 2008 protects Windows XP and Windows Vista PCs and laptops and can be installed on Windows 2003 Server and Linux Servers (Debian, Ubuntu, Red Hat and Fedora) to be fully compatible within an your existing network landscape.
